1. Introduction
    1.1. Motivation
        1.1.1. problem description
        1.1.2. goal of the thesis
    1.2. Application to the video encoding
2. Analysis
    2.1. Known approaches
        2.1.1. Client-server
        2.1.2. P2P
            • Grid networks
            • Hybrid networks
            • Pure p2p
    2.2. Existing solutions
    2.3. Framework description
        2.3.1. Basic overview
        2.3.2. Neighbor maintaining
            • Initialization
            • Neighbor discovery
            • Neighbor's failure
            • Alternatives, possible improvements
        2.3.3. Security?
        2.3.4. Networking handling
            • used approach
            • alternatives
        2.3.5. User interface
        2.3.6. Prerequisites
3. Implementation
    3.1. Networking
        3.1.1. Creating connections
        3.1.2. Protocol
        3.1.3. Error recovery
    3.2. Internal structures' overview
        3.2.1. Neighbor storage
        3.2.2. Referencing chunks
    3.3. Periodic actions
    3.4. Error detection and recovery
        3.4.1. Node failure
        3.4.2. Chunk disappearance
    3.5. Data transfers
    3.6. Handling I/O
        3.6.1. User interaction
        3.6.2. Use of ffmpeg
    3.7. Synchronization
4. Experiments
    4.1. Approach to testing
        4.1.1. Description
        4.1.2. Problems
    4.2. Results
        4.2.1. Performance improvement
        4.2.2. Influential parameters
        4.2.3. Error scenarios
5. Conclusion
